Effective temperatures (T_{eff}) and angular diameters (θ) are computed as described in the text. For the stars with HIP number, the metallicities are from the Bonfils et al. (2005) calibration, while for the remainder are obtaied with the MOITE. We only give metallicites for stars with T_{eff} above 3080 K for the reasons explained in Section 5. Apparent bolometric magnitudes (m_{Bol}) are obtained according to Section 6, where the absolute bolometric magnitude of the Sun $M_{Bol,\odot} = 4.74$. Optical colours are in the Johnson-Cousins system, whereas infrared are from 2MASS.
